

Business Continuity & Disaster Recovery Plan

Hewlett Packard Enterprise (HPE)

Document Owner: Office of Business Resilience

Classification: Internal - Restricted

Version: 4.2 | Effective Date: 2026-07-08

1. Purpose and Scope

This Business Continuity & Disaster Recovery (BC/DR) Plan establishes the strategy, roles, and procedures HPE uses to sustain and recover critical operations during a disruptive event. It covers HPE's customer-facing GreenLake hybrid cloud platform, the SAP S/4HANA enterprise resource planning (ERP) environment, and the supporting infrastructure, data, and personnel required to keep essential functions running. The plan applies to all HPE production data centers, colocation facilities, and the teams responsible for their operation.

The objective is simple: minimize downtime, protect data, safeguard people, and honor commitments to customers, partners, and regulators through disciplined preparation and rehearsed response.

2. Business Impact Analysis (BIA)

The foundation of this plan is HPE's Business Impact Analysis, refreshed at least annually and after any material change to the technology estate. The BIA identifies critical processes and essential functions, ranks them by operational and financial impact, and establishes the tolerances that drive our recovery investments.

| Critical Process | Tier | RTO | RPO |

| --- | --- | --- | --- |

| GreenLake control plane & customer workloads | 0 | 1 hour | 5 minutes |

| SAP S/4HANA ERP (finance, order-to-cash, supply chain) | 0 | 2 hours | 15 minutes |

| Identity, authentication & API gateways | 1 | 1 hour | 5 minutes |

| Customer support & entitlement systems | 1 | 4 hours | 30 minutes |

| Corporate collaboration & email | 2 | 8 hours | 4 hours |

Each recovery time objective (RTO) defines the maximum tolerable outage before impact becomes unacceptable, while each recovery point objective (RPO) defines the maximum tolerable data loss measured backward from the moment of disruption. These recovery targets are the contract between the business and the recovery teams; every technical control below exists to satisfy a documented point objective.

3. Data Protection: Backup, Replication, and Immutability

HPE protects data through layered strategy designed to meet the RPOs above:

- Immutable backups. All Tier 0 and Tier 1 datasets are written to write-once, immutable repositories with enforced retention locks. Because these copies cannot be altered or deleted-even with administrative credentials-they provide a clean recovery source that is

resilient to ransomware and insider threats.

- Snapshots. Application-consistent snapshots of SAP S/4HANA (HANA System Replication savepoints and log backups) and GreenLake volumes are captured on short intervals to satisfy the 5-15 minute RPO windows.
- Replication. Continuous asynchronous and, for the most critical databases, synchronous replication mirrors production data to a geographically separate recovery region, ensuring an up-to-date copy is always available to restore from.
- Restore verification. Backups are meaningless if they cannot be recovered. Automated restore rehearsals sample production data sets weekly and confirm integrity, recoverability, and elapsed time against the RTO.

The 3-2-1-1 principle governs all Tier 0 data: three copies, on two media types, one off-site, and one immutable.

4. Recovery Architecture: Failover and Alternate Sites

HPE operates a multi-site topology engineered for redundancy and rapid failover:

- The primary region hosts live GreenLake and SAP S/4HANA production workloads.
- A hot-site in a separate region maintains synchronously replicated data and warm-started compute, enabling near-immediate automated failover for Tier 0 services within their RTO.
- A warm-site provides pre-provisioned but scaled-down capacity for Tier 1 and Tier 2 services, activated on demand.
- A contracted alternate cloud region serves as an additional recovery landing zone if a primary provider or facility becomes wholly unavailable.

Network redundancy, load-balanced ingress, and diverse carrier paths eliminate single points of failure. Failover procedures are codified as runbooks and, where possible, automated so that human error during a crisis is minimized.

5. Crisis Governance, Succession, and Communications

Leadership and Succession

A standing Crisis Management Team (CMT) directs response. To ensure decisions are never blocked by an unavailable leader, every CMT role has a documented succession chain with named alternates, deputies, and backup personnel. Authority delegation is pre-approved so that if a primary decision-maker cannot be reached, the designated deputy assumes command without delay.

Crisis Communications

The crisis communications protocol governs how and when we inform stakeholders. Upon activation, the CMT issues structured notification to employees, affected customers, partners, regulators, and executive leadership through primary and out-of-band channels. Pre-drafted holding statements, an incident bridge, and a status page keep GreenLake customers informed of service state and expected recovery, while account teams manage direct outreach for enterprise SAP-dependent customers.

6. Testing, Exercises, and Validation

A plan that is not exercised is only a hypothesis. HPE maintains a continuous testing calendar:

- Tabletop exercises quarterly, walking leadership and technical teams through scenarios such as regional outage, ransomware, and supply-chain disruption.
- Functional drills and failover simulations semi-annually, executing live cutover of GreenLake and SAP S/4HANA to the hot-site and measuring actual RTO/RPO against targets.
- Full recovery validation at least annually, including immutable-backup restore into an isolated recovery environment.

Every exercise produces an after-action report; findings feed a corrective-action tracker with owners and deadlines.

7. Plan Maintenance and Review

This plan is a living document. Formal review and updates occur on an annual cycle and are additionally triggered by significant infrastructure changes, acquisitions, exercise findings, or lessons learned from real incidents. Maintenance responsibilities-keeping current the contact rosters, runbooks, dependency maps, and recovery targets-are assigned to the Office of Business Resilience, which certifies the plan's accuracy each fiscal year and reports readiness to the Board's risk committee.

Approved by the HPE Business Resilience Steering Committee.
